Newton's Second Law

When a net force acts on an object, the object accelerates.

This lesson asks you to connect three ideas: force, mass, and acceleration.

A heavier object needs a greater force to reach the same acceleration.

The direction of the acceleration matches the direction of the net force.

Friction is a force that can oppose motion.

Students often write F = ma and stop thinking.

Work through these ideas by talking, and do not copy a finished line.
